DSE053 Analyse Store Order Maintenance

Overview   After the requisitions have been completed, the hub produces a store order report to be reviewed and maintained. The report provides suggested stock transfers between hubs and satellites based on the requirements and current stock availability.

When the ordered stock arrives, each hub receives the items and allocates the stock to the satellites and to the hub itself by running the store order report to either produce a suggested order allocation or to automatically generate a stock transfer.

The update option is used to automatically generate the stock transfers.

Examples

This section illustrates examples concerning:

Example 1: Addition of Suggested Order for an Item

Example 2: Maintain Store Orders

Example 3: Delete a Suggested Order

Example 4: Print a Report
Example 5: Update the Transfer
