# DSO165 Definition Maintenance Reset

---

## Overview

When a user accesses a Budget Definition or Forecast Definition a flag is set preventing any other user from maintaining the Budget ID or Forecast ID until the first user has finished with it. The same applies when a Budget Generation or Forecast Generation process is being run. Only one user can generate a budget or a forecast at a time.

This security flag should clear itself when the first user ends the process normally by saving the changes made or exiting the option without making or saving changes. But, if for some reason the process does not end normally, this security flag needs to be manually reset to allow another user to access the definition or generation process.
