EDO500 Convert EDI Store Details (852)

This program converts the raw store data: store stock on hand, on order and sales details, from the ANSI X12 document to the store master.

Store details are usually updated once a week as new data comes in once a week. This data is Stock on Hand, Stock on Order and Sales that have occurred in the past week. When you update this information the previous week's data is overridden. This updates the data for all ISBNs for all stores. Raw store data is converted to the store master.

Converted details display within the Store Details Maintenance program.
