
EDO600 Create ASN Details

This program EDO600 converts dispatched container details into an ANSI X12 format. It allows for re-running dispatch details and for running once a day at End of Day. It ensures the invoice number and date is recorded at the shipment level for consignment detail recording. An ASN can be created for the EDIFACT document format. A Store Number provides for consolidated invoices.

TMSDS/EDI-ASNC is used to set up ASN customers.

When generating ASN details selection of the source of transaction code is done via **TMSDS/EDI-ASNS**.

The EDI order quantity is calculated depending on the customer order quantity set up in **TMSDS/IC-COQTL**.

This process allows for common components of the same order (that is multiple system items with the same components) when allocating the correct parent items.

The database contains:

- The volume figure based on Container type (if it exists) otherwise it is calculated from the Title Masterfile.
- Dispatch date
- Systems
- Preferred Delivery Date
- Component details which are created based on **TMSDS/EDI-ACMP**.
